Abstract

Some effects of Fe/Mo disorder on magnetic and electrical properties in $\text{Ba}_2\text{Fe}_{1+x}\text{Mo}_{1-x}\text{O}_6$ have been investigated. As x increases from 0 to 0.5, saturation magnetization decreases from 3.5 to $1.8 \mu_{\text{B}}/\text{f.u.}$ with increasing of coercivity as well as remanence. The magnitude of magnetoresistance decreases from 26% for $x = 0$ to 15% for $x = 0.5$ with magnetic fields of 0.7 T at 20 K.
